Project Title: Sales Performance Analysis

Brief Introduction

In today's competitive retail and commercial landscape, organizations generate massive volumes of transactional data across multiple regions, channels, and product categories. Understanding how different products, customer segments, and sales channels perform over time is essential for sustainable revenue growth. This project focuses on examining historical sales records to uncover key revenue drivers, seasonal trends, and operational bottlenecks, ultimately establishing a clear foundation for data-driven commercial decision-making.

Problem Statement

Despite having access to extensive historical sales records, many businesses struggle to accurately identify which specific products, regions, or customer segments are driving profitability versus dragging down margins. Without a unified view of sales performance, leadership teams often rely on fragmented reporting and intuition, leading to missed revenue opportunities, inefficient inventory allocation, and inconsistent forecasting. Consequently, there is a critical need to systematically evaluate sales data to pinpoint performance gaps and understand the underlying factors affecting overall revenue growth.
